CAREERS

Meteorology

Meteorology is the study of the earth's atmosphere. Scientists observe and report on the changes of the atmosphere and how it affects the earth and its inhabitants.

Trinidad and Tobago Meteorological Service

At the Trinidad and Tobago Meteorological Service (TTMS), meteorological observers, meteorologists and climatologists observe past and present weather events, predict future weather and changes to our climate.

The TTMS sends weather and climate information to key stakeholders including the media and they distribute the information to the public.

Hello I am Ana, I am a Meteorological Assistant

This means I am responsible for making observations and recording weather conditions to be used for forecasting the weather and for receiving and transmitting meteorological data. I studied Physics and Mathematics at secondary school, then I went to the Caribbean Institute of Meteorology & Hydrology (CIMH) in Barbados to learn weather observing procedures.

What does a Met Assistant do?

A Met. Assistant:

- ↓ Observes weather conditions (visually or with the use of meteorological instruments);
- ↓ Plots on charts, meteorological data such as rainfall and temperature;
- ↓ Receives and sends relevant data by using wireless and other electronic equipment (eg. Weather balloon);
- ↓ Prepares climatological summaries;
- ↓ Compiles and maintains statistical records of weather observations.

Hi I am Mya, I am a Meteorologist

A meteorologist is someone who studies the atmosphere. He or she uses scientific methods along with weather instruments to understand, observe, forecast and explain the earth's atmosphere. To become a meteorologist you must study Meteorology at CIMH or another accredited tertiary institution.

What does a Meteorologist do?

A Meteorologist:

- ☀️ Forecasts the weather. For example if it is going to be rainy, sunny or cloudy;
- ☀️ Helps protect lives as the information can be used to protect persons on

land, at sea and in the air;

Helps persons plan and prepare for their day;

Keeps the public informed of events such as floods, landslides, thunderstorms, storms, hurricanes and other weather related events.

Hi I am Clive, I am a Climatologist

The climate is often described as weather conditions that are constant in a particular area for a long period of time. A climatologist is a scientist who studies the earth's climate. Changes in the climate may lead to changes from year to year and may lead to drought, flooding and other weather related events.

What does a Climatologist do?

As a Climatologist I:

- 🌍 Monitor the climate and analyse data gathered for 30 years or more;
- 🌍 Produce reports based on scientific research;
- 🌍 Provide an outlook for a longer period than a meteorologist;
- 🌍 Provide climate information to sectors such as agriculture, energy, water, disaster management and tourism.
